

CONFIDENTIAL — PARTNER DISCUSSION

SafeCover

Embedded microinsurance for e-commerce and retail POS: business case, architecture, and partnership path for a licensed insurer.

Prepared May 2026 · Builds on internal white paper draft ("Embedded MicroInsurance Platform Business Model") and the SafeCover reference implementation.

Executive summary

SafeCover is an API-first embedded microinsurance orchestration layer: quotes, bind, payment-aligned confirmation, webhooks, and a unified retail **POS** flow—so merchants can offer contextual protection without sending shoppers to a separate insurance journey.

Ask to the carrier: pilot one filed product (or rider) through SafeCover's integration surface, connect your PAS and claims rails, and co-sell through one anchor distributor (e-commerce or POS)—proving attach rate, loss behaviour, and operational fit in 90–120 days.

Market opportunity (from your draft, tightened)

Embedded insurance continues to shift purchase from "go find a policy" to "protect this basket, trip, or ticket *now*." Industry commentary commonly cites embedded as a multi-tens-of-billions gross-premium trajectory this decade; exact forecasts vary by scope definition, but the **strategic direction** is consistent: ecosystems win distribution, and carriers win when they meet partners with **APIs, speed, and clear compliance hooks**.

Microinsurance fits short, well-defined exposures (shipment, device, ticket, cyber add-ons). SafeCover's codebase is explicitly oriented to **scenario-based** offers and **multi-provider** comparison in demo—useful for workshops, with production paths to a **single approved carrier** per market.

Illustrative curve for discussion only—not a firm market forecast.

Stakeholder value

Index scores are qualitative workshop aids, not scored research.

What SafeCover is today (reference stack)

Distribution surface

- Node.js Express API: quote, bind, confirm, webhook, claims stubs
- POST /api/pos/enhanced for retail: quote, bind, confirm, or sale
- Universal widget + adapters: Shopify, WooCommerce, BigCommerce, Magento, generic
- WooCommerce PHP plugin path for server-side checkout

Insurer-grade hooks (prototype)

- Strict mode: API keys, quote signing, registered quotes at bind, CORS allowlist
- Webhook HMAC, bind idempotency, regulatory_snapshot on policies
- Env placeholders: carrier entity, license ref, filing code, wording version
- Solidity contract in repo; on-chain issuance from API is a roadmap item

See repository README.md, docs/API.md, docs/PRODUCTION.md, and docs/WHITEPAPER-CODEBASE-MAP.md for line-level mapping.

Business & technology architecture

The platform is deliberately **thin at the edge** (merchant UX) and **strict at the core** (quote integrity, payment alignment, audit metadata). Your PAS remains the system of record; SafeCover accelerates **front-end integration** and **transactional consistency** up to the handoff you define.

Policy lifecycle (payment-aligned)

Business case for the insurer

- **Distribution leverage:** reach digital-native volumes through checkout and POS rather than standalone D2C acquisition.
- **Product modularisation:** scenario-tariff modules (retail, logistics, hospitality, healthcare, cyber in demo) map to filed “ingredients” you approve.
- **Operational efficiency:** server-to-server APIs, idempotent binds, webhook contracts—reduce leakage and duplicate coverage.
- **Innovation narrative:** embedded + optional ledger path (where legally and technically appropriate) for transparency.

Commercial splits are illustrative; actual economics depend on role (MGA vs broker vs tech fee), channel, and filings.

Proposed pilot (90–120 days)

Phase	Outcomes
1 · Design	Chosen scenario(s), tariff mapping, disclosures, sandbox PAS events.
2 · Integrate	Strict mode in staging; webhook to PAS; confirm on payment capture; fraud checks.
3 · Live limited	One merchant or franchise POS cohort; monitoring, loss run, UX metrics.
4 · Scale decision	Attach rate, conversion impact, claims cycle, partner revenue—go / refine / pause.

Transparency (builds underwriting trust)

The reference implementation **does not** replace filings, capital, licensed claims payment, or PAS depth. Items explicitly called out in docs/WHITEPAPER-CODEBASE-MAP.md as not yet wired include on-chain issuance from the API, parametric oracle payouts, and full carrier billing integration—**these are partnership build scope**, with SafeCover supplying the distribution orchestration skeleton you see in the repo.

Sources carried forward from your draft

BCG embedded insurance tech stack (2025); industry surveys on checkout protection preference; case patterns (e.g. airline attach, marketplace warranty uplift); Etherisc / parametric microinsurance references—as cited in your original Word document. SafeCover does not reproduce third-party charts here; use your compliance-approved versions where needed.
